1 Using formats to get SAS to print something other than the values a variable actually contains

We will be using the billionaire dataset again today. Its variable called `region` contains abbreviations ("A" for Asia, "E" for Europe, etc.). If we want SAS to print out the complete words instead of the abbreviations, so that tables and graphs are more understandable, we need to run a “proc format” before the data step. The data step must then refer to the formats defined in the format procedure.

The `formchar` option is needed when printing tables as we will be doing later in the lab. You can copy it in from the file `formchar.sas` in the Datasets listing.

```sas
options linesize = 75
formchar = "|----|+|---+=|-/\<>*";
proc format ;
value $regfmt 'A' = 'Asia' 'E' = 'Europe' 'M' = 'Middle East'
        'O' = 'Other' 'U' = 'US' ;
run ;
```

Because the original data values in the region variable are characters rather than numbers, we have to use a dollar sign as the first character in the name of the format.

Note the format statement in the data step below. It tells SAS to apply the format you have defined here to a particular variable. When you use the format statement in a data step, you must put a period at the end of the format name.

```sas
options linesize = 75
formchar = "|----|+|---+=|-/\<>*";
proc format ;
value $regfmt 'A' = 'Asia' 'E' = 'Europe' 'M' = 'Middle East'
        'O' = 'Other' 'U' = 'US' ;
run ;
```

2 Using labels to get SAS to print more descriptive variable names

```sas
data billion ;
input wealth age region $ ;
format region $regfmt. wealth amtfmt. ;
label wealth = 'Wealth in Billion $'
    age = 'Age in Years' ;
datalines ;
<data>
run ;
```

Now enter and run the following code to see how the formats and labels affect the output of the “print” and “freq” procedures.

```sas
proc print data = billion (obs = 20); run ;
proc print label data = billion (obs = 20); run ;
proc freq data = billion ;
tables region ; run ;
```

3 Formats for numeric variables

Formats can also be used to group numeric data. Add a line to your format procedure and change one line in the data step as follows:

```sas
proc format ;
value $regfmt 'A' = 'Asia' 'E' = 'Europe' 'M' = 'Middle East'
        'O' = 'Other' 'U' = 'US' ;
value amtfmt low-<5 = '<5' 5-<10 = '5-<10' 10-<20 = '10-<20' 20-high = '20+' ;
run ;
data billion ;
input wealth age region $ ;
format region $regfmt. wealth amtfmt. ;
label wealth = 'Wealth in Billion $'
    age = 'Age in Years' ;
datalines ;
<data>
run ;
```

To see the effect of adding this format:

```sas
proc print data = billion ; run ;
proc freq data = billion ;
tables wealth ; run ;
```

4 Proc means

Gulanick ([*Heart and Lung*, 1991]) studied patients who were recovering from heart surgery. She was interested in whether different combinations of supervised exercise or teaching would affect patients’ self-efficacy (or confidence) to perform physical activity.

 Patients were randomly assigned to one of three groups. Group 1 received teaching, treadmill exercise testing, and exercise training three times per week. Group 2 received only teaching and exercise testing. Group 3 received only routine care without supervised exercise or teaching. After 4 weeks, each patient was scored on self-efficacy.

 Self-efficacy was measured on a continuous scale and scores were assumed to be distributed normally in each of the populations of interest. Her results are in the dataset “gulanick.dat.” We wish to produce a table that shows the number of observations and the mean and standard deviation of scores within each of the three groups.

```sas
proc format ;
value grpfmt 1 = 'Teaching and Training' 2 = 'Teaching' 3 = 'Neither' ;
run ;
```
We can use `proc means` to get various summary statistics in a more compact format than `proc univariate` provides. The default statistics provided are:

- **n** = number of observations
- mean
- std dev = standard deviation
- minimum
- maximum

The following code will produce means for this dataset of the values in the variables “wealth” and “age.”

```sql
proc means data = billion n mean ;
var wealth age ;
title 'Average Age and Wealth of 1992 Billionaires' ;
run ;
```

The MEANS Procedure

<table>
<thead>
<tr>
<th>Variable Label</th>
<th>N</th>
<th>Mean</th>
</tr>
</thead>
<tbody>
<tr>
<td>wealth</td>
<td>228</td>
<td>64.031111</td>
</tr>
<tr>
<td>age</td>
<td></td>
<td>233.00</td>
</tr>
</tbody>
</table>

Average Age and Wealth of 1992 Billionaires

Since our dataset contains an observation for every billionaire in the world in 1992, if the population of interest is billionaires in 1992, is this a population mean or a sample mean?

If we want a separate mean for each region, we must first make sure that the dataset is sorted in order by region, and then run `proc means` with an additional “by” statement.

```sql
proc sort ;
by region ;
run ;
```
PROC MEANS DATA = BILLION N MEAN;
VAR WEALTH AGE;
BY REGION;
TITLE 'Average Age and Wealth of 1992 Billionaires';
TITLE2 'By Region';
RUN;

Average Age and Wealth of 1992 Billionaires
By Region 7

The MEANS Procedure

Variable Label N Mean
--------------------------------------
worth Wealth in Billion $ 38 2.6210526
age Age in Years 37 63.6486486

------------------------------ region=Europe -----------------------------
Variable Label N Mean
--------------------------------------
worth Wealth in Billion $ 80 2.2075000
age Age in Years 76 64.0263158

-------------------------- region=Middle East --------------------------
Variable Label N Mean
--------------------------------------
worth Wealth in Billion $ 22 4.2636364
age Age in Years 22 64.2272727

----------------------------- region=Other -----------------------------
Variable Label N Mean
--------------------------------------
worth Wealth in Billion $ 29 2.2344828
age Age in Years 28 64.1428571

----------------------------- region=US -----------------------------
Variable Label N Mean
--------------------------------------
worth Wealth in Billion $ 64 2.9687500

proc means data = billion ;
class region ;
var wealth age ;
run ;

Average Age and Wealth of 1992 Billionaires
By Region 6

The MEANS Procedure

Variable Label N Mean
--------------------------------------
worth Wealth in Billion $ 64 2.9687500
age Age in Years 62 64.1451613

------------ region=Asia ------------
